

ArchiMate® for NAF v4

Update from The Open Group NATO/NAF ArchiMate Mapping Working Group

Marc Lankhorst, BiZZdesign Eugene McSheffrey, MEGA International

June 19, 2019

Agenda

- 1. Mapping NAFv4 to the ArchiMate® standard: background and challenges
- 2. Addressing the challenges using ArchiMate®

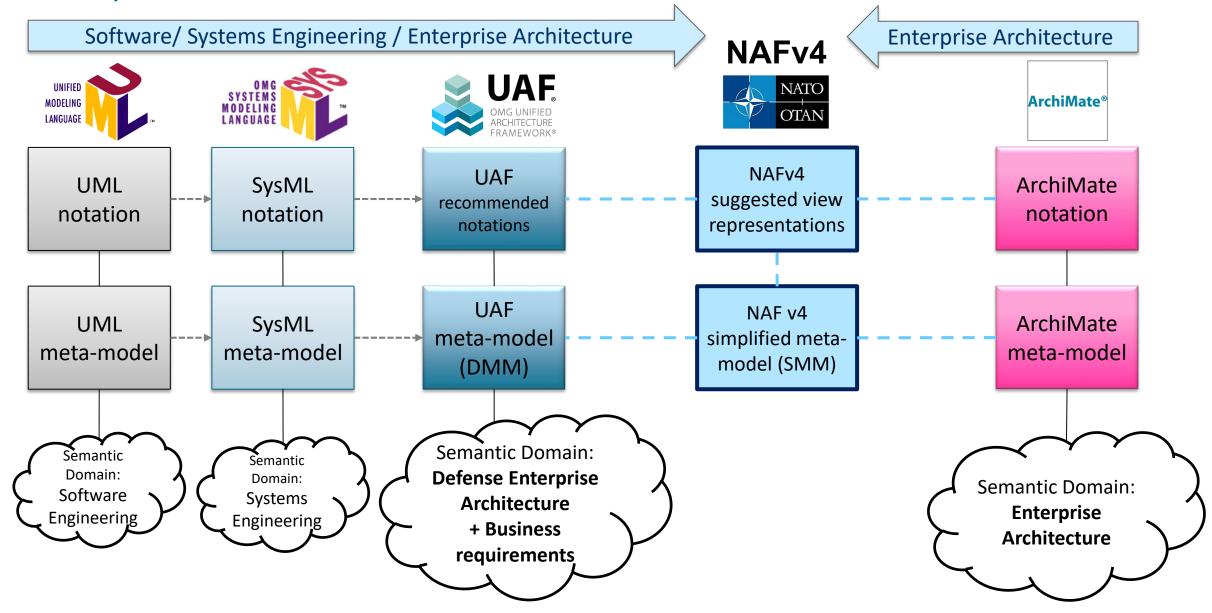

Mapping ArchiMate® to NAFv4

- » NAFv4: One framework, two metamodels:
- 1.3 NAFv4 compliant architectures can be creating using the following meta-models; The Open Group®'s ArchiMate® and the Object Management Group®'s Unified Architect Framework (UAF) ® Domain Meta-model (DMM)®.

NATO Architecture Framework Version 4

- » Not prescribed in the standard:
 - The mapping of NAF viewpoints and concepts to ArchiMate and UAF
 - How to implement the suggested representations for viewpoints using the metamodels
- » The Open Group is working to establish a standardized mapping for the ArchiMate standard and NAFv4

NAF, UAF® and ArchiMate®

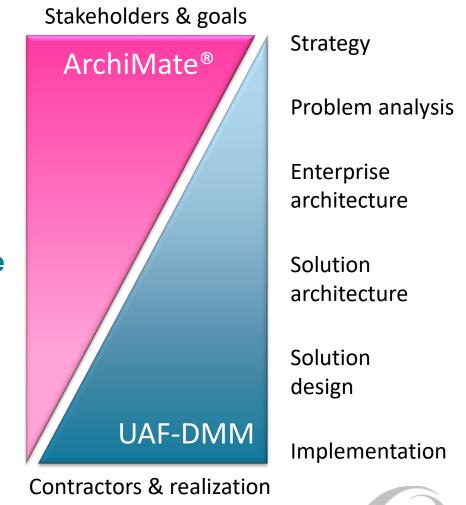

ArchiMate® vs. UAF® Domain Metamodel (UAF-DMM)

» ArchiMate standard:

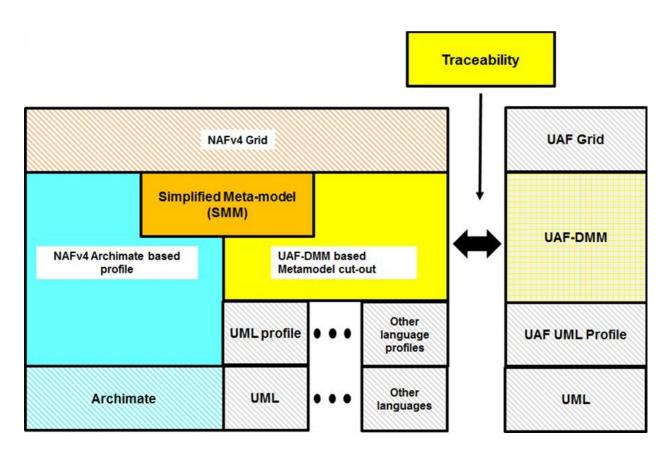

- Focused on enterprise architecture, stakeholders & goals, translating strategy into action, problem space
- Upstream, communication of the essentials

» UAF-DMM:

- Focuses on acquisition and enterprise architecture
- Can handle systems engineering, requirements of contractors & realization in the solution space
- Upstream, communication of acquired capabilities
- Downstream, implementation-level details

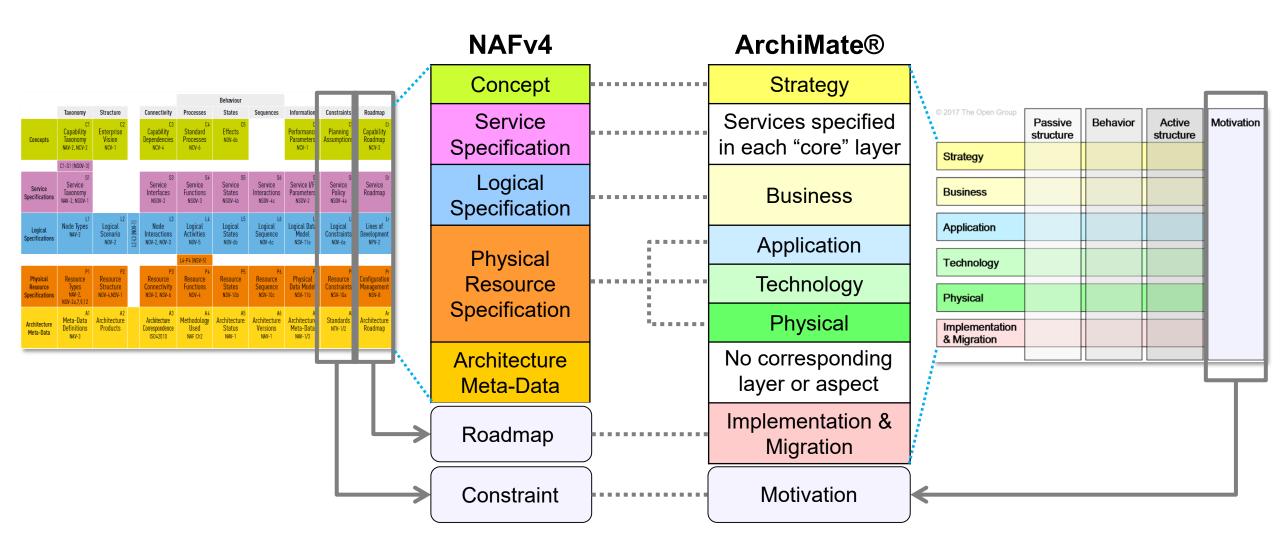

ArchiMate®, UAF® and the NAFv4 Simplified Meta-Model (SMM)

- » ArchiMate® and UAF-DMM have a different focus but have the potential to be combined
- » ArchiMate is a single language, allowing different visualizations (views)
- » Uaf-DMM is an open meta-model that can be implemented by different language profiles

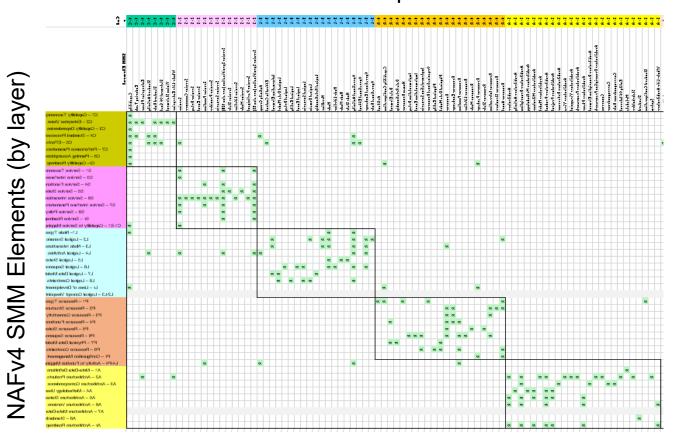

Correspondences between frameworks

Layers and viewpoints

NAF v4

Prescribed viewpoints

» Most viewpoints are defined for specific cells in the grid, with relatively few elements from other layers.

ArchiMate®

Example viewpoints (informative)

» Viewpoints often cross layers to provide an overview. New viewpoints can be defined as required

Metamodel concepts ArchiMate® **NATO** NAFv4 71 concepts > 120 concepts (60 elements + (in SMM) 11 relationship types) » A one-to-one mapping for all concepts in the different metamodels should not be expected > 200 concepts The underlying (including type/ instance ontologies are different and composite structures)

Scope

The ArchiMate standard provides a way to show dependencies between models of different architecture domains that are typically created using specialized notations

Some differences between the ArchiMate language and UML/SysML

- » The ArchiMate language was designed with communication in mind, more than engineering
- » UML supports additional specificity that is not available in the ArchiMate language. e.g.
 - UML Class Diagrams can be used to elaborate ArchiMate Active Structure Elements such as Application Components, and information elements such as business and data objects.
 - UML State Machine Diagrams can be used to represent state transitions of elements defined in ArchiMate models.
 - UML Sequence Diagrams express object interactions and can be used to elaborate ArchiMate behaviour elements.
- » No type-instance distinction
 - The ArchiMate language intentionally does not support a difference between types and instances. This is less relevant in enterprise architecture (which is mostly concerned with types) and makes models more difficult to understand for non-technical audiences.
- » Simple composition model
 - In comparison, SysML has a structured composition model (block/part) with structured boundaries (ports etc.)
 - ArchiMate interface and service concepts can be used to model such boundaries but you may need to enforce a modeling convention

Challenges

- 1. How should the ArchiMate metamodel be used to construct NAF-compliant architectures?
 - How can NAF viewpoints be expressed in the ArchiMate language?
 - Should the language be extended to enable the use of concepts and/or viewpoint representations that are not supported in the ArchiMate standard?
- 2. How can NAF architectures be constructed in a way that enables the best use of both the ArchiMate® and UAF® metamodels?
 - How should teams using different metamodels exchange model content?
 - How should teams using both metamodels integrate their work to produce a consistent architecture?
- 3. How to encourage adoption and promote best practice for using the ArchiMate and UAF standards for NAF?

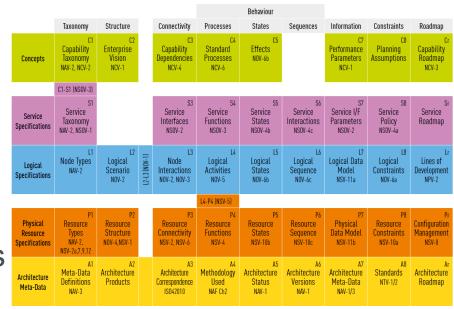

Agenda

- 1. Mapping NAFv4 to the ArchiMate® standard: background and challenges
- 2. Addressing the challenges using the ArchiMate language

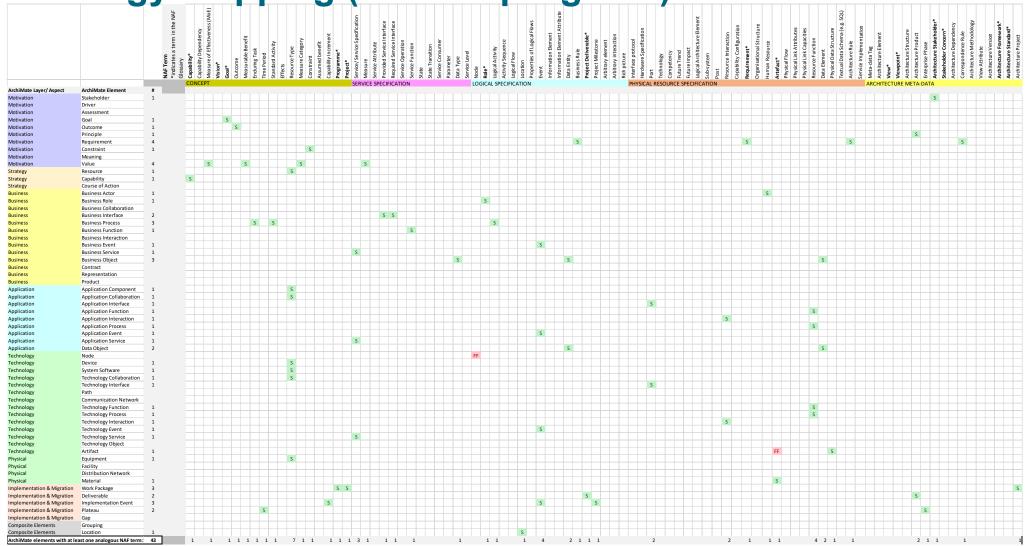

How to make the ArchiMate language work for NAF?

Work in progress by The Open Group ArchiMate Forum Working Group:

- 1. Map NAF terms to corresponding ArchiMate concepts
 - Close match found (so far) for many of the NAF terms, and more with some specializations
- 2. Express NAF v4 views in ArchiMate notation
 - Mapping of applicable views
 - Good examples are key, e.g. the Federated Mission Networking architecture is already being expressed in ArchiMate
- 3. Let ArchiMate notation work with other standards
 - It was designed to do so from the beginning

Viewpoint mapping

Many possible representations:

- Lists, matrices and other tables can of course be generated from models in any modeling language, including ArchiMate
- 2. ArchiMate standard notation is well-suited for many NAF views
- Next to the standard notation, the ArchiMate language also allows for other representations. See the chapter on Architecture Views & Viewpoints in the standard

Mapping on the next slides is provisional!

NAF v4 viewpoint representations (work in progress)

Customization and modeling conventions

- » The ArchiMate language has a built-in language customization mechanism, which you can use to define specializations of concepts
 - E.g. 'Organization Unit' as specialization of 'Business Actor'
 - These can have their own specific sets of properties
- » In addition, you can define **modeling conventions** to restrict the use of ArchiMate concepts and notation, e.g.:
 - Use services and interfaces instead of 'direct' connections between elements
 - Use triggering relationships between processes and flows between functions to express behavior

The ArchiMate language and other standards

Integrated architecture leveraging the two NAF meta-models

How the ArchiMate language works with other standards

- » The ArchiMate standard connects architectural domains
 - It doesn't replace other standards but provides an 'umbrella' on top
 - Broader scope, but less detailed
 - Those details can be expressed in other languages
- » Some concepts in the ArchiMate standard are taken from BPMN, UML, BMM and others
 - This intentional overlap makes it possible to link to e.g. UML descriptions of detailed design or BPMN process models
 - In some cases there are structural differences between the languages that preclude a direct concept-to-concept mapping, requiring a pattern-based approach
- » This way you can combine stakeholder-oriented, enterprise-level ArchiMate models with development-oriented, engineering-level models in other standards
- » The ArchiMate Model Exchange File Format standard allows ArchiMate models interchange between different tools supporting interoperability and information sharing. This represents a key benefit while interacting with other standards

Conclusions (1)

- » Viewpoints from Enterprise Architecture & Systems Engineering are complementary
 - You need both in a full design trajectory
 - But there may be a difference in use between 'upstream' clients (e.g. from NATO partners) and 'downstream' contractors (e.g. the defense industry)
- » The ArchiMate language is well-suited for NAF v4
 - Initial assessments suggest substantial coverage of concepts and viewpoints
 - In particular for communication, strategy, enterprise architecture, coherence across domains, and other 'upstream' products
 - Avoids unnecessary complexity for stakeholders who don't need that
- » NATO's requirements analysis for NAF v4 shows that neither standard covers all, so a combination is needed
 - UAF-DMM satisfied 37%, ArchiMate 65% of weighted requirements

Conclusions (2)

- » The ArchiMate standard plays well with other standards like UML and SysML
 - It was designed to do so from the start
 - This makes a combined ArchiMate® UAF-DMM approach feasible
- » The ArchiMate Model Exchange File Format makes it easy to share architecture content with other organizations (and their tools)
 - A key benefit in a collaborative environment like NATO
- » Good examples are key!
 - E.g. the Federated Mission Networking (FMN) ArchiMate model being developed by NATO

Thank you!
